

Greening adjustments and economics

Workshop, June 27, 11:00 – 12:30

Coordinator: Thomas de Witte

I. Background

- (1) The EU Commission introduced the Greening with the CAP Reform in 2014. Since then farmers have to fulfill standards regarding the crop rotation and create ecological compensation conservation areas on 5% of their arable land.
- (2) Therefore, the question arises how these measures are reflected in our typical farms and how high the resulting costs are?

II. Goals

- (1) Show how member states have introduced the Greening measures
- (2) Show how typical farms realized the Greening measures in different EU countries
- (3) Calculate the costs of the Greening measures

III. Key questions to address

- (1) What are the options to fulfill the Greening in different countries?
- (2) What do most farms do to fulfill the Greening obligations? (if available please also show some statistics)
- (3) How did the typical farms implement the Greening?
- (4) How did you enter the Greening measures in the typical farms?
- (5) How high are the resulting costs?
